     Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Score

Chaudhry A.Z., Lyons G.E., Gronostajski R.M.;
Expression patterns of the four nuclear factor I genes during mouse embryogenesis indicate a potential role in development.";
Dev. Dyn. 208:313-325(1997).
-I- FUNCTION: CTF/NF-I RECOGNIZE AND BIND THE PALINDROMIC SEQUENCE 5'-
TTGGCUNNINGCCAA-3' PRESENT IN VIRAL AND CELLULAR PROMOTERS AND IN
THE ORIGIN OF REPLICATION OF ADENOVIRUS TYPE 2. THESE PROTEINS ARE
INDIVIDUALLY CAPABLE OF ACTIVATING TRANSCRIPTION AND REPLICATION.
-I- SUBGUITT: BINDS DNA AS AN HOMODIMER.
-I- SUBCELLULAR LOCATION: NUCLEAR.
-I- ALTERNATIVE PRODUCTS: DIFFERENT FORMS OF CTF/NF-I CAN BE PRODUCED
BY DIFFERENTIAL SPLICING OF THE SAME GENE.
-I- STMILARITY: BELONGS TO THE CTF/NF-I FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SEQUENCE FROM N.A.

Nucleic Acids Res. 18:2607-2616(1990).

-1- FUNCTION: CTF/NF-I RECOCNIZE AND BIND THE PALINDROMIC SEQUENCE 5'-TTGGCNNNINGCCAA-3' PRESENT IN VIRAL AND CELLULAR PROMOTERS AND IN THE ORIGIN OF REPLICATION OF ADENOVIRUS TYPE 2. THESE PROTEINS ARE INDIVIDUALLY CAPABLE OF ACTIVATING TRANSCRIPTION AND REPLICATION.

-1- SUBCULIVE BINDS DIA AS AN HOMODIMER.

-1- SUBCULIVAR LOCATION: NUCLEAR.

-1- ALTERNATIVE PRODUCTS: DIFFERENT FORMS OF CTF/NF-I CAN BE PRODUCED BY DIFFERENTIAL SPLICING OF THE SAME GENE.

-1- MISCELLANEOUS: IN CHICKEN NET/TAGGCA PROTEINS ARE ENCODED BY AT LEAST THERE INTERPREDICTION CENEC. NET-A NET-D AND NET-D 
                                                                                                                                                                                   This
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      EMBL; X84209; CAA58995.1; -.

RT "CDNA Cloning, expression, and chromosomal localization of human N-

RT acetylglucosaminyltransferase III (GnT-III).";

RI J. Biochem. 113:692-698(1993).

CC -!- FUNCTION: IT IS INVOLVED IN THE REGULATION OF THE BIOSYNTHESIS AND

CC -!- FUNCTION OF CALCETYL-GLOCOSAMINE IN BETA 1-4 LINKAGE TO THE

BIOLOGICAL FUNCTION OF THE TRIMANNOSYL CORE OF N-LINKAGE SUGAR

CC THE ADDITION OF THE MOST IMPORTANT ENZYMES INVOLVED IN THE

CC CHAINS. IT IS ONE OF THE TRIMANNOSYL CORE OF N-LINKAGE SUGAR

CC CHAINS. IT IS ONE OF THE MOST IMPORTANT ENZYMES INVOLVED IN THE

CC REGULATION OF THE BIOSYNTHESIS OF GLYCOPROTEIN OLIGOSACCHARIDES.

CC -!- CATALYTIC ACTIVITY: UDP-N-ACETYL-D-GLYCOSAMINE + N-ACETYL-BETA-D-

CC GLUCOSAMINYL-1, 2-ALPHA-D-MANNOSYL-1, 3 (N-ACETYL-BETA-D-GLYCOSAMINYL-

CC GLUCOSAMINYL-1, 3-ALPHA-D-MANNOSYL-1, 5 DETA-D-MANNOSYL-1, 4-N-

CC ACETYL-BETA-D-GLUCOSAMINYL-1, 2-ALPHA-

CC D-MANNOSYL-1, 4-N-ACETYL-BETA-D-GLUCOSAMINYL-1, 2-ALPHA-

Schmitt I., Epplen J.T., Riess O.;

Predominant neuronal expression of the gene responsible for dentatorubral-pallidoluysian atrophy (DRPLA) in rat.";

Hum. Mol. Genet. 4:1619-1624(1995).

1- TISSUE SPECIFICITY: PREDOMINANT NEURONAL EXPRESSION, ALTHOUGH MARKEDLY REDUCED AMOUNTS ARE FOUND IN MOST OTHER TISSUES.

1- DEVELOPMENTAL STAGE: SIMILAR EXPRESSION AT ALL DEVELOPMENT STAGES (DAY 14.5 P.C., 17.5 P.C., NEWBORNS AND ADULTS).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               01-OCT-1996

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        hits satisfying chosen parameters:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            binding. They can be prepared by chemical synthesis or by use of crecombinant DNA techniques. The peptide antagonists are used as an antiinflammatory agents in the treatment of gastrointestinal inflammation, where they bind to the ZOT receptor in the intestine cand yet does not physiologically modulate the opening of TJ in the cintestine. Gastrointestinal inflammation conditions give rise to increased intestinal permeability and the peptide is useful for treating intestinal conditions that cause protein losing enteropathy caused by infection, e.g. Clostridium difficile infection, enterocolitis, shigellosis, viral gastroenteritis, parasite enterocolitis, shigellosis, viral gastroenteritis, parasite collagenous colitis, inflammatory bowel disease, diseases with mucosal erosion or ulcerations, e.g. gastricts, gastric cancer, collagenous colitis, inflammatory bowel disease, diseases with sprophatic obstruction, e.g. congenital intestinal lymphanglectasia, sarcoidosis lymphoma, mesenteric tuberculosis, and after surgical correction of congenital heart disease with Fontan's operation, mucosal diseases without ulceration, e.g. Menetrier's disease, coeliac disease, eosinophilic gastroenteritis, and immune disease, e.g. gastroenteritis, parameted by the coeliac disease, eosinophilic gastroenteritis, parameted by the coeliac disease, eosinophilic gastroenteritis, and immune disease, e.g. gastroenteritis, parameted by the coeliac disease, eosinophilic gastroenteritis, and immune disease, e.g. gastroenteritis, parameted by the coeliac disease, eosinophilic gastroenteritis, parameted by the coeliac disease.

mucosal erosion or ulcerations, e.g. gastritis, gastric cancer, collagenous colitis, inflammatory bowel disease, diseases marked by lymphatic obstruction, e.g. congenital intestinal lymphangiectasia, sarcoldosis lymphoma, mesenteric tuberculosis, and after surgical correction of congenital heart disease with Fontan's operation, mucosal diseases without ulceration, e.g. Menetrier's disease, coeliac disease, eosinophilic gastroenteritis, and immune diseases, e.g. systemic lupus erythematosus or food allergies, primarily to
                                                                                                                                                                                                                                                          recombinant DNA techniques. The peptide antagonists are used as an antiinflammatory agents in the treatment of gastrointestinal inflammation, where they bind to the ZOT receptor in the intestine and yet does not physiologically modulate the opening of TJ in the intestine. Gastrointestinal inflammation conditions give rise to increased intestinal permeability and the peptide is useful for treating intestinal conditions that cause protein losing enteropathy caused by infection, e.g. Clostridium difficile infection, enterocolitis, shigellosis, viral gastroenteritis, parasite infestation, bacterial overgrowth, whipple's disease, diseases with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           which bind to a zonula occludens toxin (ZOT) receptor, yet do not physiologically modulate the opening of mammalian tight junctions (TJ). The peptide antagonists are based on a common motif of ZOT and human zonulins, which is believed to be critical for receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New peptide antagonist of zonulin useful as antiinflammatory agent treating cerebral ischemia, stroke, cerebral edema, gastritis, shigeilosis, viral gastroenteritis, meningitis, encephalomyelitis
